

Review for the first exam

The answers

Nikos Apostolakis

Disclaimer The following is a set of questions to help you review what we have covered in class. If you know how to answer these questions then you should do well in the exam. However there is no guarantee that the questions in the actual exam will be perceived to be similar to these questions.

1. Evaluate: $7 - 3(2 - 7) - 3^3 \div 9 \cdot 3$ **13**

2. Evaluate: $\frac{-25}{16} \cdot \frac{20}{-9} \cdot \left(-\frac{54}{11}\right) \cdot \frac{6}{-7} \cdot \frac{77}{50}$ **$\frac{45}{2}$**

3. Evaluate: $-4^2 + 4(-6 + 10)$ **0**

4. Evaluate, if $a = -\frac{3}{4}$, $b = \frac{7}{8}$ and $c = -\frac{1}{12}$: $-6a + 10b - 7c$ **$\frac{83}{6}$**

5. Evaluate if $x = -7$ and $y = -5$: $y^2 - x^2$. **-24**

6. Evaluate if $a = 3$, $b = -2$, $c = 7$, $d = 2$, and $x = -1$: $\frac{ax + b}{cx + d}$ **1**

7. Evaluate if $x = 3$: $x^3 - 4x^2 + x + 6$ **0**

8. Solve the equation:

$$-2(5x - 1) + 3 = 5(-2x + 2) + 8$$

This is a contradiction. No solution.

9. Solve the equation:

$$\frac{2x - 10}{3} - \frac{x + 3}{2} = -3x + 11$$

$x = 5$

10. Solve the equation:

$$3(5x - 4) - 7x = 8x - 12$$

This is an identity. All numbers are solutions.

11. Solve the equation:

$$4(2x - 1) + x + 7 = 3(6x - 5) - 2x + 11$$

$x = 1$

12. Solve for a : $\frac{2ac}{x} - 2 = 7x - 5$ **$a = \frac{7x^2 - 3x}{2c}$**

13. Solve the following inequality, give the answer using interval notation and graph the solution set.

$$3(x - 2) + 5 > 5x - 11$$

Answer. $5 > x$. As an interval this is $(-\infty, 5)$.

□

14. Solve the following inequality, give the answer using interval notation and graph the solution set.

$$7 - 2(3x - 3) \leq -2x - 5$$

Answer. $\frac{9}{2} \leq x$. As an interval this is $[\frac{9}{2}, \infty)$.

□

15. The length of a rectangle is 3 inches less than 5 times its width. If the perimeter of the rectangle is 54 inches find its dimensions.

Answer. The length is 22 inches and the width is 5 inches.

□

16. The sum of three consecutive integers is 33. Find the three integers. $10, 11, 12$

17. The coordinates of a solution to the following equation:

$$7x + 2y = -20$$

are consecutive integers. What's the solution? $(-2, -3)$

18. Graph the line with equation $-3x + 2y = 6$ in the following grid.

19. Find the slope and the x - and y -intercepts of the line with equation $2x - 5y = 20$.

Answer. Slope is $\frac{2}{5}$. x -intercept is 10 and y -intercept is -4 . □

20. A line has slope -3 and passes through the point $(1, 7)$. Find its equation. $y = -3x + 10$
21. A line passes through the points with coordinates $(2, 3)$ and $(-1, 3)$. Find its equation. $y = 3$
22. A line passes through the points with coordinates $(-2, 13)$ and $(2, -7)$. Find an equation for this line. $y = -5x + 3$
23. A line passes through the points with coordinates $(-10, 3)$ and $(-10, -4)$. Find its equation. $x = -10$
24. A line is parallel to the line with equation $4x - 2y = 3$ and contains the point with coordinates $(-3, 4)$. Find the equation of this line. $4x - 2y = -20$
25. A line passes through the point $(2, -11)$ and is parallel to the line with equation $x = -1$. Find its equation. $x = 2$
26. A line is perpendicular to the line with equation $3x - 5y = 7$ and contains the point $(-2, -7)$. Find its equation. $5x + 3y = -31$
27. A line is parallel to the line with equation $5x + 3y = 11$ and passes through the point $(2, -3)$. Find its equation. $5x + 3y = 1$

28. Find an equation for the line whose graph is shown below:

$$y = -x + 1$$

29. Do the lines with equations $y = 5x + 1$ and $y = 5x - 2$ intersect? Justify your answer.

Answer. These lines have the same slope so they are parallel. Therefore they don't intersect.

30. Do the lines with equations $2x - 3y = 11$ and $3x + 5y - 12 = 0$ intersect? Justify your answer.

Answer. These lines have different slopes, so they are not parallel. Therefore they must intersect.
